

MedDeFi Tokenomics (Post-TGE)

Overview

Once MedDeFi launches publicly, the MED token transitions from its pre-sale role into the core utility and alignment mechanism for the protocol. Designed with non-inflationary, real-yield mechanics, MED tokens power staking, access, and governance throughout the MedDeFi ecosystem.

Circulating Supply at TGE

- Pre-sale tokens (vested): 2,000,000
- Circulating supply at launch: approx. 2,000,000 MED
- Total Supply: 100,000,000 MED (fixed)

Revenue Sharing Model

- **5% of all platform revenue** (from medical tourism payments and future services) is split:
- **5% → Rewards Pool** (distributed to eligible stakers)
- **5% → Liquidity Pool** (used to deepen token market and stabilize price)

Milestone-Based Token and Staking Expansion

- Additional token tranches and staking slots will be unlocked **based on protocol growth milestones**, such as:
- Revenue thresholds (e.g., \$500k monthly)
- User adoption (e.g., 10,000 active wallets)
- DAO-approved governance proposals
- This ensures that **supply grows only when demand and utility justify it**
- Prevents inflation and preserves yield integrity for early participants

Staking Reward Strategy (Revenue-Based Drip Model)

- The staking reward pool includes two sources:
- **5% of protocol revenue (in stablecoins)** — distributed daily
- **A capped token emission vault** (e.g., 5M MED tokens total), which activates only when the protocol meets revenue milestones

Revenue-Based Drip Triggers

Monthly Revenue	Token Drip Rate
<\$50,000	0% (paused)
\$50K–\$100K	50% emission rate

Monthly Revenue	Token Drip Rate
\$100K–\$200K	100% emission rate
>\$200K	125% (bonus emission window)

- Emission vault is capped and streamed over a multi-year period
- DAO may vote to pause, adjust, or accelerate based on market conditions

Staking Architecture

Tiered Staking Pools

- **Genesis Pool** (capped):
- Reserved for pre-sale and early TGE stakers
- Permanent access to full reward share
- **Tier 2/3 Pools:**
- Access opens dynamically based on protocol earnings thresholds
- If revenue drops, lowest tier may be deactivated temporarily to protect APR

Daily Yield Distribution

- Rewards Pool is divided **daily** among all active stakers
- Formula:
- $$(\text{User Stake} \times \text{Loyalty Multiplier}) / \text{Total Effective Stake} \times \text{Daily Rewards Pool}$$

Loyalty Multiplier System

Tier	Duration	Multiplier
Initiate	<30 days	0.80x
Believer	30–90 days	0.90x
Partner	>90 days	1.00x
Legacy (opt-in bonus)	>180 days or DAO contributor	1.10x

Dynamic Access Control

- Staking slots are capped per tier
- Waitlist logic: unstaked slots are automatically filled from queue
- APR is protected by preventing overflow

Anti-Dilution & Yield Integrity

- Staking pool yield is protected by:
- Fixed 5% revenue contribution (non-inflationary)
- Capped participation slots

- Tiered deactivation logic (revenue-linked)

LP Growth & Token Utility

- The Liquidity Pool grows daily via 5% of revenue, ensuring:
- Constant trading depth
- Reduced sell pressure
- Flexibility to open new pairs as ecosystem expands

Ecosystem Expansion

- The Rewards Pool and Liquidity Pool will be reinforced by revenue from:
- Future MedDeFi services
- Tokenized diagnostics, doctor access tokens, AI health products
- DAO-driven product launches that contribute to the Unified Yield Engine

Governance (Phase 2+)

- MED token holders will participate in:
- Protocol upgrades
- Yield policy adjustment proposals
- Expansion voting (e.g., which services contribute to the rewards pool)

Summary

MedDeFi's tokenomics are designed for resilience, fairness, and growth. Rather than rely on emissions, MED delivers: - Yield based on real usage - Scarcity-based staking access - Deepening liquidity - Aligned participation across the ecosystem

No inflation. No dilution. Just evolving utility.
